Case Study 27

Is your central data team slowing everyone down?

When every data request depends on a single team, speed and scalability take a hit.

We helped a major retailer overcome this by implementing a Decentralized Data Mesh Architecture — transforming how data flows across the organization.

✅ **Data as a Product: Domain teams own and serve their data.**
✅ **Decentralized Processing: Snowflake/BigQuery for local agility, global view intact.**
✅ **Central Governance: Security, quality, and metadata — unified.**

The result? Faster, self-service BI with data teams finally empowered to move at business speed.

It's time to democratize your data. 🚀
